**BASELINE ASSESSMENT AND KEY INTERVENTIONS TO IMPROVE FOLLOW-UP ADHERENCE, RECURRENCE RATES AND ASSOCIATED FACTORS AFTER PRECANCEROUS CERVICAL LESION TREATMENT IN RURAL ETHIOPIA**

I aim to

- a) assess the levels of follow-up adherence and recurrence rate;
- b) evaluate different strategies to improve the follow-up adherence level after women treated for pre-CC lesions.

I will use formative assessment and observational studies to determine the follow-up adherence, recurrence rates, and associated factors among women treated with pre-cervical cancerous lesions. Then, a pragmatic randomized control trial will be used to evaluate key intervention strategies.

I expect to provide feasible and effective interventions that improve the follow up level.
